

## Summit Award® – Clinical, Core Measures Criteria and Benefits

Three years of data from 2008 to 2010 for 26 clinical measures from the acute myocardial infarction, heart failure, pneumonia, and surgical infection prevention measure sets were used to calculate quarterly composite scores for each measure set. The resulting 12 quarterly data points per measure set were used to calculate four measure set specific performance scores which were then combined to obtain an overall performance score. In order to be considered a winner, hospitals had to be among the top 3% on the overall performance score, while also demonstrating consistent high levels of performance across all four measure sets.
